MICROBIOLOGY — HONOURS

Paper : DSE-B-1

(Inheritance Biology)

Full Marks : 50

The figures in the margin indicate full marks. Candidates are required to give their answers in their own words as far as practicable.

Answer question no. 1 and any three questions from the rest.

1. Answer any ten questions :

- (a) Write down Mendel's principle of independent assortment.
- (b) What is the difference between incomplete dominance and co-dominance?
- (c) What is expressivity? Give example.
- (d) Define epistasis.
- (e) What do you mean by pseudoautosomal gene?
- (f) What is Barr body?
- (g) Differentiate between allopolyploid and autopolyploid.
- (h) Write down the cause of Down syndrome.
- (i) Define isochromosome.
- (j) What kind of pairing configuration would be observed in prophase of meiosis I in (i) an inversion heterozygote. (ii) a translocation heterozygote?
- (k) A woman with no history of colour blindness marries a colour blind man. What is the risk for this couple of having a child with colour blindness?
- (l) Define map unit. What is the centimorgan?
- (m) How does extra nuclear inheritance differ from nuclear inheritance?
- (n) What is philadelphia chromosome?
- (o) Differentiate between multiple alleles and pseudo-alleles.
- 2. (a) Criss-cross inheritance is shown by sex influence traits. Justify the statement.
 - (b) How many chromosomes would be found in somatic cells of an allotetraploid derived from two plants one with N = 7 and the other with N = 10?
 - (c) Define dominant epistasis and duplicate recessive epistasis with appropriate example.

3. (a) A Drosophila female heterozygous for the recessive X-linked mutation w (for white eyes) and its wild type allele w^+ is mated to a wild type male with red eyes. Among the sons, half have white eyes and half have red eyes. Among the daughters, nearly all have red eyes, however a few have white eyes. Explain the observation.

(2)

(b) The following three recessive genes are found in corn : 6+1 : brittle endosperm; gl17 : glossy leaf; rgdl : ragged seedling A trihybrid of unknown origin is test crossed which produces the following offsprings—

Brittle, glossy, ragged	1:	2	36	
Brittle, glossy :		2	41	
Ragged :		2	219	
Glossy :			23	
Wild type :		2	24	
Brittle, ragged :			17	
Glossy, ragged :			21	
Brittle :			19	
Total :		10	00	
	1.	1	1	1

- (i) If the genes are linked determine the relative order and map distances.
- (ii) Reconstruct the chromosome of the trihybrid.
- (iii) Is there any cross over interference? If yes, how much? 3+(3+2+2)
- 4. (a) What is cytoplasmic inheritance?
 - (b) Why are some *Paramecuim* called killer *Paramecium*?
 - (c) Write down what you know about maternal effect.
 - (d) Briefly explain the endosymbiotic theory.
- 5. (a) Genes a and b are X-linked and are located 7 m.u. apart on the X chromosome of Drosophila. A female of genotype $[a^+b/ab^+]$ is mated with a wild type $[a^+b^+/y]$.
 - (i) What are the probability that one of her sons will be either a^+b^+ or ab^+ in phenotype?

3+2+3+2

3+2+3+2

- (ii) What is the probability that one of her daughters will be a^+b^+ in phenotype?
- (b) F2 plants segregate ³/₄ coloured : ¹/₄ colourless. If the colour-plant is picked at random and selfed, what is the probability that both coloured and colourless plants will be seen among a large number of its progeny?
- (c) An individual with Turner syndrome would be expected to have how many Barr bodies in the majority of cells? Explain with reason. 4+3+3
- 6. (a) Describe Holliday model with schematic representation.
 - (b) Discuss the role of Rec A protein in genetic recombination.
 - (c) What do you mean by karyotyping? Write down any two applications of the method.
 - (d) What is microsatellite DNA? Elaborate with example.
